

Milestone-H: Repository Publication and Test Evidence Verification

Fresh public clone and evidence check

1 Document details

Field	Value
Prepared by	Darvin Anorma Mangampo
Assessment period	7 to 9 October 2026 (UTC+08:00)
Cloned commit	885d9b91174111cf59aa990b61d7801f841a736a
Document date	9 October 2026

2 Purpose and starting point

Milestone-H checked whether the maintained command in the public root README would run from a fresh clone. It also checked public access to the reports from Milestone-A through Milestone-G and several evidence files. On 9 October, the clone ran one Milestone-D readiness method and the six Milestone-F SauceDemo methods. All seven passed on the first test-command attempt.

Work from Milestone-A through Milestone-D established the inherited starting point and a maintained test lane. Milestone-E documented 19 manual SauceDemo variations. Milestone-F developed six new Selenium workflows using the manual cases completed in Milestone-E. The scripts followed their steps and checked their expected results. Milestone-G compared the same seven methods across three runs. Milestone-H added no test case. It checked execution against the XML, then prepared a smaller evidence set for publication.

3 Publication starting point

On 8 October, the local and remote heads matched the Milestone-G handoff commit 3593870f. The inherited baseline tag was present, and Milestone-A through Milestone-G each had a README and PDF. The published Milestone-E, Milestone-F and Milestone-G result counts matched the available evidence. From the Milestone-F source commit 5a4a023 to that Milestone-G handoff, there was no change in the maintained source or execution configuration. The two protected workbooks also matched their published hashes.

The fresh-clone check used the root README published at commit 885d9b91. That version gave the maintained SauceDemo command and linked to Kamil Nowocin's original AutomationPractice repository. The older suite remains separate from the reported SauceDemo results.

4 Fresh clone execution

I cloned the public repository into a separate folder and used its published commit 885d9b91174111cf59aa990b61d7801f841a736a. Its source and execution configuration still matched the Milestone-F source commit. From the root README, I ran this command once:

```
.\gradlew.bat --init-script .\gradle\timestamped-build.init.gradle automationReadiness milestoneFAutomation --rerun-tasks --no-build-cache --no-daemon --console=plain
```

Gradle printed OUTPUT_DIR for run 20261009-112238-516. It finished with BUILD SUCCESSFUL in 1m 23s. The exit code captured immediately afterwards was 0, meaning the command completed successfully. The four JUnit-style XML files show the actual methods and outcomes. There was no later test attempt.

XML suite	Executed	Passed	Failed	Errors	Skipped
Readiness	1	1	0	0	0
AuthenticationTests	2	2	0	0	0
CheckoutTests	2	2	0	0	0
InventoryAndCartTests	2	2	0	0	0
Total	7	7	0	0	0

Each expected method appeared once. No inherited AutomationPractice method appeared. The clone's tracked files stayed clean before and after the command. This was a same-machine check on Windows 11 with Temurin Java 21.0.12.1+1 and Gradle 8.14.5. Chrome was 154.0.8037.98, with ChromeDriver 154.0.8037.92. An isolated Gradle home was not used.

5 Workbooks and publication copies

Both protected workbooks kept the same SHA-256 values before and after the run. These values match the earlier Milestone-F and Milestone-G evidence:

Workbook	SHA-256
testdata.xlsx	9ECECF817507E4762A560DD1BFDA6C563B79648114B4121C1C54906CFDA07B9C
backup-testdata.xlsx	A09FB992C49034F0465F5ECEA42628F1EA9BB6C7668F1523789B2FBD0F5366A2

The accompanying evidence set has one focused log and the four XML results under Milestone-H/Execution Results/first-attempt-20261009-112238-516/. The README links to them. The PowerShell transcript missed Gradle's native output, so the focused log was prepared from the saved visible console text. It keeps the command, OUTPUT_DIR, test output, build line and immediately captured exit code. The generated build folder was not copied into Milestone-H. Its passing images show individual page states, while the focused log and XML show the seven method outcomes and command result. Milestone-F already publishes checkpoint images for these workflows. No Milestone-H test failed, so no failure image was produced.

The prepared copies replace the local repository path with [repository]. In the XML, [local-host] replaces the computer name. Each XML copy parsed successfully. Its method names and outcomes matched the retained original. Suite counts and time fields matched too. The changed path and hostname text is disclosed in the README.

6 Current site and public access

At about 11:50 a.m. on 9 October, the SauceDemo sign-in page loaded with the Swag Labs title and Login button. Username and password fields were visible. No credentials were entered. This brief observation cannot show whether the site changed between earlier milestones.

The public GitHub check opened the baseline and comparison links from the root README. The licence opened too. The README and PDF file pages for Milestone-A through Milestone-G opened, along with representative evidence from Milestone-E, Milestone-F and Milestone-G. The PDF pages offered raw downloads. The check did not cover every inline preview. The completed Milestone-G work is described as repeat runs, which is what its evidence shows.

7 Scope and conclusion

The fresh clone passed all seven expected methods on its first command attempt. The README and PDF file pages for Milestone-A through Milestone-G opened through public GitHub links on 9 October. Several evidence files from Milestone-E through Milestone-G opened too. These findings support publishing a bounded Milestone-H verification result. The work did not repeat Milestone-E's 19 manual variations or run the inherited AutomationPractice suite.

The result is ready to report for this Windows machine and Chrome version. It does not establish cross-machine portability or another browser's result. The brief site check does not establish long-term availability, and no release decision was part of Milestone-H.
